## INTRODUCTION

The Nevada Critical Congenital Heart Disease (CCHD) Registry is administered by the Maternal, Child and Adolescent Health Section of the Bureau of Child, Family and Community Wellness, Nevada Division of Public and Behavioral Health (DPBH), Nevada Department of Health and Human Services (DHHS) to implement Nevada Revises Statutes (NRS) 442.680.

The purpose of the Nevada CCHD Registry is to ensure all children born in Nevada are screened for CCHD at birth and those identified with CCHD receive timely and appropriate medical intervention. A pilot project began in 2013 after the need for a CCHD Registry was identified. Nevada Revised Statutes [442.680](#) was passed in the 77<sup>th</sup> Legislative Session of the Nevada Legislature (Appendix A). The 2021 CCHD report represents the sixth full year of data with all nineteen birthing facilities reporting. The Nevada CCHD Registry follows [national guidelines](#) and the infant screening procedural flow may be summarized as follows (see also Appendix E):

*A newborn passes pulse oximetry screening if the oxygen saturation is 95% or greater in the right hand or right foot and the difference is 3% or less between the right hand and right foot. The screen is immediately failed if the oxygen saturation is less than 90% in the right hand or right foot. If the oxygen saturation is 90% or greater, but less than 95% in the right hand and right foot, or there is more than a 3% difference between the right hand and right foot, the screen is repeated in one hour and follows the same process as above. Some newborns will require three screens (the initial and two repeat screens, all separated by one hour). A baby whose oxygen saturation is 90% or greater, but less than 95% in the right hand and right foot, or who has more than a 3% difference between the right hand and right foot after the third screen, will be considered to have failed screening.*

The Nevada CCHD Registry promotes timelines endorsed by the American Academy of Pediatrics (AAP) outlined in Appendix B and promoted by the Centers for Disease Control and Prevention (CDC, <https://www.cdc.gov/ncbddd/heartdefects/hcp.html>).

1. All hospitals or freestanding birthing centers must screen all newborns after 24 hours of birth and prior to 48 hours of life to determine if the newborn exhibits CCHD (Appendix A).
2. If it is determined the infant exhibits CCHD, the attending physician must report the condition to the DPBH Chief Medical Officer or a representative thereof and discuss the condition with those responsible for the care of the infant.

## PROGRAM FUNDING

There is no funding allocation for the CCHD Registry which receives no portion of newborn screening fees or dedicated federal funds, unlike other newborn screens.

## PARTNERS AND STAKEHOLDERS

Meeting the goals and purposes of NRS 442.680 requires a coordinated effort by multiple partners within national, state, public, and private sectors. The American Heart Association (AHA) and the Nevada Hospital Association (NHA) were supporters of the original legislation and continue to be key partners.

All birthing facilities in Nevada provide CCHD screenings through pulse oximetry tests given to infants as close as possible to the recommended 24-48-hour period, prior to discharge, and report this data to the State using a standardized form. Facilities report whether the newborn received screening, passed or failed screening, how many screenings occurred, and if the newborn was referred to higher levels of care such as neonatal intensive care unit (NICU), echocardiogram, etc. These data are then entered into a secure registry database. Technical assistance is provided to all Nevada Birthing Facilities as necessary.

Nevada CCHD Registry is supported by the Title V Maternal and Child Health (MCH) Program Children and Youth with Special Health Care Needs (CYSHCN) Program Coordinator who works collaboratively with a variety of Nevada DPBH and DHHS programs and partner agencies. These programs include, but are not limited to:

- Nevada State Birthing Facilities
- Nevada Chapters of AHA
- NHA
- University of Nevada, Reno (UNR), Newborn Screening (NBS) Program and Advisory Board
- Nevada Office of Vital Records
- Nevada Office of Analytics
- Nevada Early Hearing Detection and Intervention (EHDI) Program
- Nevada Maternal, Infant, and Early Childhood Home Visiting (MIECHV) Program
- Title V MCH Maternal and Infant Health Program (MIP)

## STATISTICAL OVERVIEW

Congenital heart defects (CHDs) are malformations of the heart or major blood vessels occurring before birth.<sup>1</sup> About 40,000 births per year are affected by CHDs, accounting for 4.2% of all infant deaths.<sup>2,3</sup> About one in four babies born with a heart defect has a critical congenital heart defect (CCHD).<sup>4</sup> CCHD represents a group of heart defects; abnormal or absent chambers, holes in the heart, abnormal connections in the heart, and abnormalities in the function of the heart. Some babies affected by CCHD may look and act healthy at first, but within hours or days after birth they can have serious complications. CCHD is a life-threatening condition requiring intervention within the first year of life.<sup>4</sup>

In 2021, 88.7% of all infants born in Nevada hospitals received required pulse oximetry screening prior to discharge.

In 2021, the Nevada CCHD database included a total of 32,655 births. A total of 28,959 (88.7%) were documented as receiving a pulse oximetry screening. Of the 3,696 (11.3%) infants without documentation of a screen, 254 passed away, 1,934 were sent to NICU, 1,603 infants received echocardiograms, 157 were confirmed missed screens, 156 were transferred to or from another facility, and 9 parents or family members declined screening for their infants. The confirmed missed screens were all documented as receiving either doctor or family notification from the birthing facility.

A total of 58 failed pulse oximetry screenings were reported in 2021. Five (5) infants failed the first screening but passed the second screening. Another 15 infants failed their first screening and were immediately recommended for follow-up care. There were 7 infants that failed both the first and second screenings. After failing the second screening, follow up care was initiated by hospital staff. There were 6 infants who failed all three screenings and follow-up interventions were noted for all. The diagnosed condition is not collected in the CCHD Registry and is unknown for these 58 infants, but follow-up and a higher level of care was sought to ensure these infants received appropriate medical interventions.

The 1,603 infants who received echocardiograms did not receive a pulse oximetry screening; however, they are noted as echocardiograms in hospital reporting and are not captured in the CCHD Registry otherwise due to the diagnostic cardiac ultrasound they received. The 1,934 infants admitted to NICU do not receive screenings due to the higher level of care they receive being monitored in NICU.

The CCHD Registry collects screening information but does not necessarily capture confirmed cases of CCHD. Based on electronic birth and hospital inpatient billing data, the DHHS Office of Analytics reported 50 diagnosed cases of CCHD in 2021 for infants under one year of age. Of the 50 CCHD cases, 62% were term births, and 54% were in the normal birth weight range. Racial/ethnic data of infants diagnosed with CCHD are as follows. In 2020, White infants comprised most diagnoses in Nevada (44.4%), followed by Hispanic infants (38.9%), and Black infants (15%). In 2021, Hispanic infants comprised most diagnoses (40%), followed by White infants (26%) and Black infants (14%). For reference, 5.7% of Nevada's estimated 2021 population are children under 5; within that age group, 37.5% are estimated to be White, 38% Hispanic, and 14.4% Black.<sup>5</sup>

## CHALLENGES

Many of the challenges related to CCHD data collection in Nevada are also seen nationwide. Despite the benefits of prenatal detection, only 50% to 70% of patients with CCHD are diagnosed before birth nationally, and there exists significant variability across regions.<sup>6</sup> Diagnosing infants with CCHD before they leave the hospital is a challenging problem which has been reduced, yet not eliminated, through the utilization of advancements in technology. One study demonstrated among 460,467 live births, there were 916 infants with CCHD, 13.8% of these children left the hospital without a diagnosis, and 11.7% infants died from CCHD before any diagnosis was made.<sup>7</sup>

While pulse oximetry screenings may help in detecting cyanotic heart conditions, noncyanotic conditions, such as coarctation of aorta, may go undetected in asymptomatic infants.<sup>8</sup> Prior to discharge, some infants with CCHD will have normal exams and not appear cyanotic. Often the ductus arteriosus does not close until after the infant goes home. Before closing, the ductus arteriosus may provide a significant amount of blood flow to the lungs or body. As a result, babies with CCHD can quickly decompensate when the ductus arteriosus closes. Pulse oximetry can accurately detect the lower oxygen saturations associated with CCHD with ductal-dependent systemic or pulmonary blood flow. Current recommendations for pulse oximetry screenings suggest that a failed screening be followed up by only one, as opposed to two additional screenings.<sup>9</sup>

If left undetected, heart defects in infants may result in death; however, CCHD is often treatable if detected early. Problems can range from mild to severe, requiring little intervention to multiple stages of open-heart surgeries.

Although Nevada has made significant progress since the inception of the CCHD Registry, several challenges remain with the collection of CCHD Registry data. Although all facilities are reporting their total number of births, screenings, and discrepancies, homebirth providers are not reporting CCHD screening data. An additional challenge of CCHD data collection is the lack of details reported on follow-up care needed for infants who failed one or more screening or those receiving higher levels of care (i.e., echocardiogram and NICU admits).

## IMPROVEMENT STRATEGIES

Nevada CCHD Registry is meeting these challenges by sustaining strong collaborative relationships with each of the birthing facilities. This collaboration is strengthened through regular communication, including sharing reporting guidance and a Nevada-specific factsheet.

To ensure the CCHD protocol and associated timeframes are followed with fidelity, the following strategies have been incorporated:

- Facilitate timely and accurate reporting of data to Nevada CCHD by hospitals.
- Facilitate appropriate training to all providers (hospital screeners).
- Identify and disseminate the latest best practice guidelines to providers.
- Facilitate open communication among all partners.
- Work to improve the functionality of the Nevada CCHD Registry data system.
- Standardize reporting via improvements to the form and CCHD data collection process.

This year, increasing the efficacy of reporting methods from partnering hospitals was the primary area of focus for the Nevada CCHD Registry. This goal will continue into next year, with special emphasis on the implementation of a new reporting system. Identification of CCHD diagnoses in infants going to higher levels of care without screenings will also be a focus of quality improvement efforts.

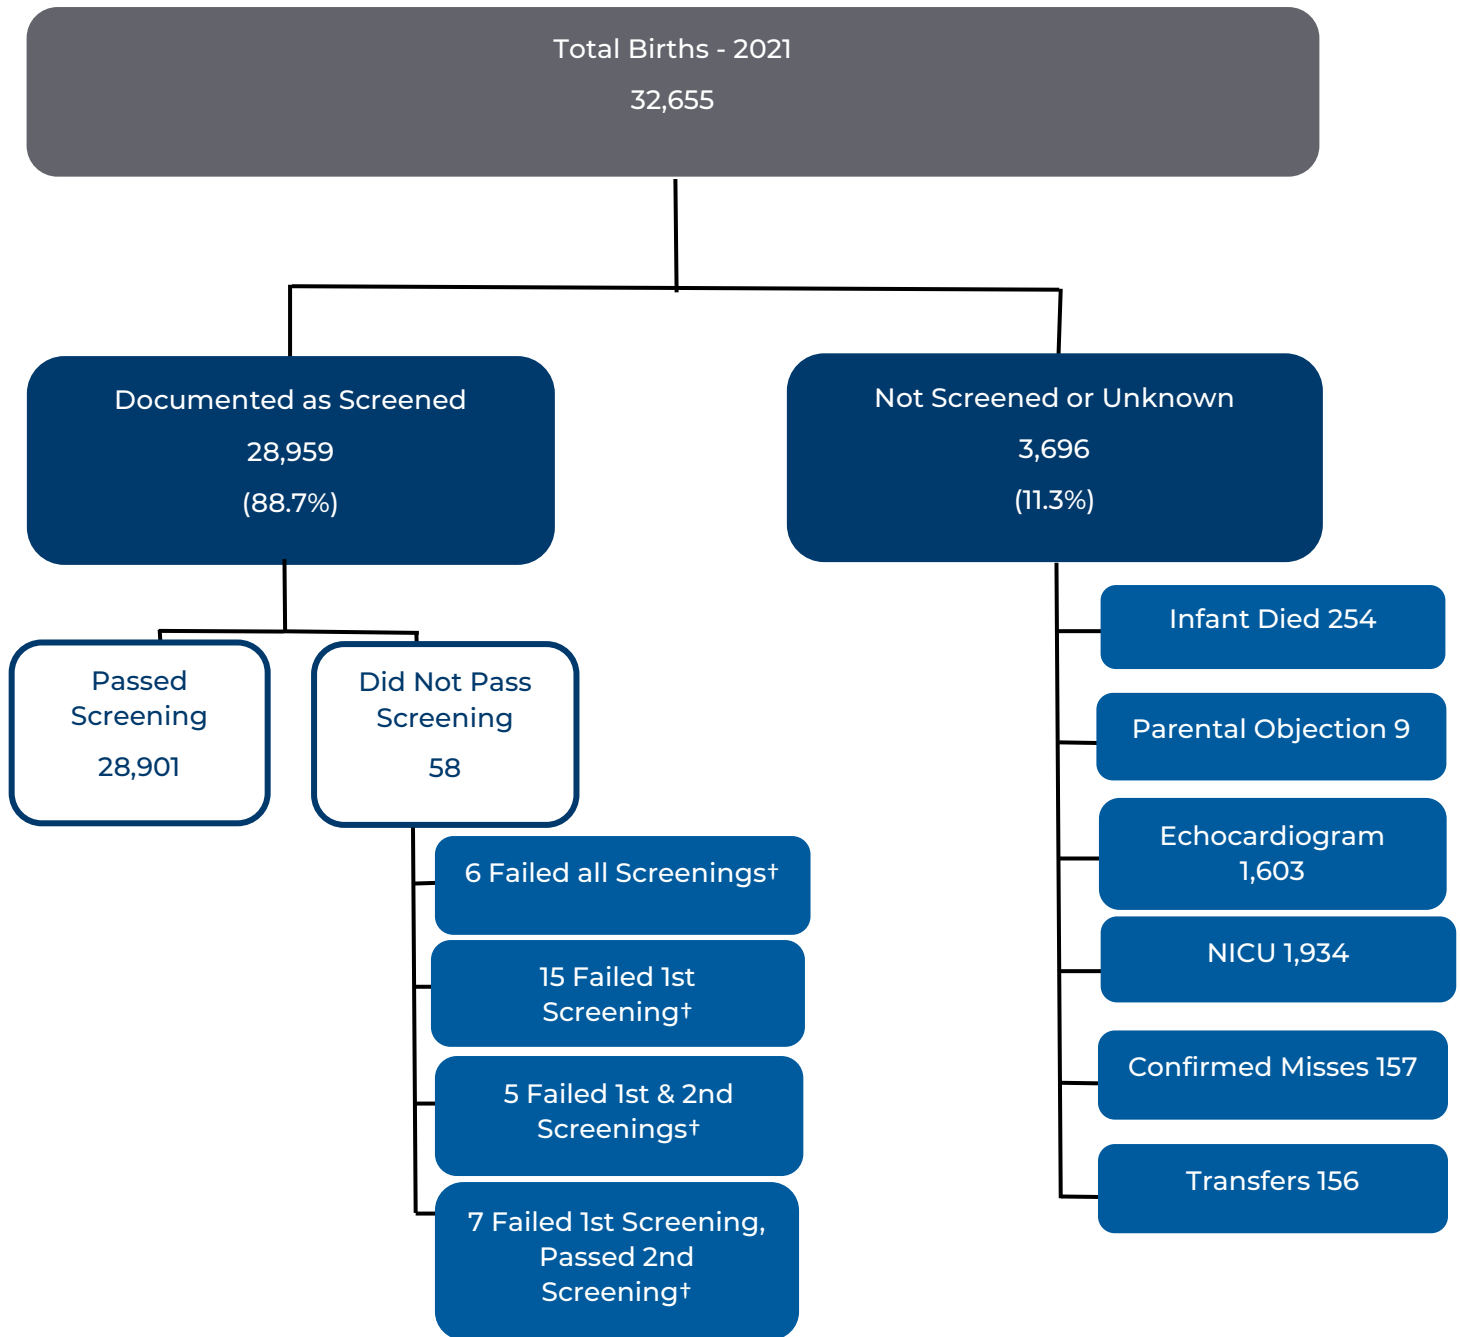

Decreasing annual CCHD-related mortality rates remains a key goal of the Nevada CCHD Registry efforts. Evaluation and quality improvement of current processes will continue in order to increase the overall percentage of all births screened, and to develop new pathways and funding sources to better address referral, follow-up, loss to follow-up and loss to diagnosis as the CCHD Registry matures beyond its fifth-year goals of statewide universal screening and reporting.

## RECOMMENDATIONS

The following recommendations to improve upon the Nevada CCHD Registry include:

- Dissemination of 2021 CCHD Report to stakeholders statewide, including AHA, NHA, parents of infants diagnosed with CCHD, CYSHCN, UNR NBS Program, Nevada Early Hearing Detection and Intervention (EHDI), NEIS, Nevada Interagency Coordinating Council (ICC), Family Navigation Network, Mountain States Regional Genetics Network and providers.
- Establish data linkage between CCHD Registry and in-patient hospitalization data to address CCHD diagnosis in infants moved to higher levels of care before pulse oximetry screen can be performed.
- Develop standardized process to identify all infants diagnosed after hospital discharge or home birth.
- Finalize and implement an updated digital CCHD data management system and provide appropriate training for key staff at participating hospitals in the new data uploading process.

## Map 1 – Birthing Hospitals in Nevada

The location and distribution of all birthing hospitals in Nevada are detailed in the map below.

### Nevada Birthing Facilities:

- Banner Churchill Community Hospital
- Carson Tahoe Regional Medical Center
- Centennial Hills Hospital
- Henderson Hospital
- Humboldt General Hospital
- Mountain View Hospital
- Northeastern Nevada Regional Hospital
- Renown Health
- Saint Mary's Regional Medical Center (closed in 2022)
- St. Rose Dominican Hospital - San Martin
- St. Rose Dominican Hospital - Siena
- Serenity Birth Center (opened in 2020)
- Southern Hills Hospital & Medical Center
- Spring Valley Hospital
- Summerlin Hospital
- Sunrise Hospital and Medical Center
- University Medical Center
- William Bee Ririe Hospital
- Mike O'Callaghan Federal Hospital

## APPENDIX A

### Nevada State Policy Recommendations

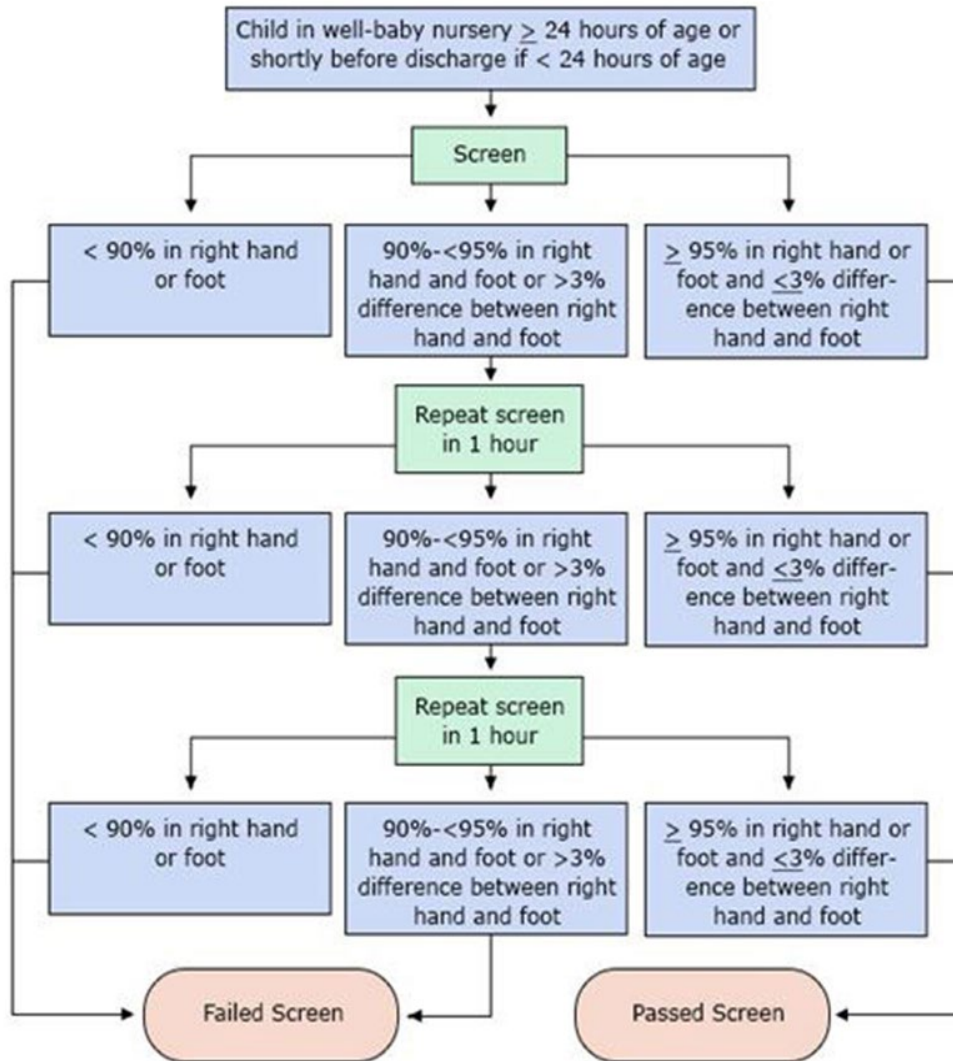

The State of Nevada worked with the American Heart Association (AHA), Nevada Hospital Association (NHA), and other stakeholders to implement Nevada Revised Statutes (NRS) 442.680, to require critical congenital heart disease (CCHD) screening reporting.

As a requirement of NRS 442.680, the Nevada CCHD program collects data from all birthing facilities on all infants born in the State.

All hospitals or freestanding birthing center must screen all newborns after 24 hours of birth and prior to 48 hours of life to determine if the newborn suffers from CCHD. All birthing facilities report the total number of infants born each month at their facility and the total number of pulse oximetry screenings performed. If there is a discrepancy in these numbers, hospitals are asked to explain the reason. Explanations provided by hospital staff include fetal demise, parent or family refusal, infants born at the end of the month prior to the 24-48-hour recommendation were to be included in the next month's report, transfer to a higher level of care such as another facility or a neonatal intensive care unit (NICU), echocardiogram ordered (higher level of care), or missed screenings.

## APPENDIX C

### Nevada Revised Statutes (NRS)

#### EXAMINATION OF INFANTS FOR CRITICAL CONGENITAL HEART DISEASE

NRS 442.680 Examination required; confirmation of results; exception to requirement; regulations.

1. Except as otherwise provided in subsection 3, any physician, midwife or nurse attending or assisting in any way any infant at childbirth at a freestanding birthing center or a hospital which regularly offers obstetric services in the normal course of business and not only on an emergency basis shall make or cause to be made an examination of the infant, to determine whether the infant may suffer from critical congenital heart disease, including, without limitation, conducting pulse oximetry screening. If the physician, midwife or nurse who conducts the examination is not the attending physician of the infant, the physician, midwife or nurse shall submit the results of the examination to the attending physician of the infant.

2. If the examination reveals that an infant may suffer from critical congenital heart disease, the attending physician of the infant shall conduct an examination to confirm whether the infant does suffer from critical congenital heart disease. If the attending physician determines that the infant suffers from critical congenital heart disease, the attending physician must:

(a) Report the condition to the Chief Medical Officer or a representative of the Chief Medical Officer; and

(b) Discuss the condition with the parent, parents or other persons responsible for the care of the infant and inform them of the treatment necessary for the amelioration of the condition.

3. An examination of an infant is not required pursuant to this section if either parent files a written objection with the person responsible for conducting the examination or with the freestanding birthing center or hospital at which the infant is born.

4. The State Board of Health may adopt such regulations as necessary to carry out the provisions of this section.

(Added to NRS by 2013, 2115)

## APPENDIX D

### Nevada Administrative Code (NAC)

#### INFORMATION CONCERNING BIRTH DEFECTS AND ADVERSE BIRTH OUTCOMES

NAC 442.052 Definitions. (NRS 442.320) As used in NAC 442.052 to 442.058, inclusive, unless the context otherwise requires, the words and terms defined in NRS 442.305, 442.310 and 442.315 have the meanings ascribed to them in those sections.

(Added to NAC by Bd. of Health by R176-99, eff. 2-10-2000)

NAC 442.054 Review of certain records; identification and contact of patient. (NRS 442.320) In carrying out the provisions of NRS 442.300 to 442.330, inclusive, the Chief Medical Officer or a representative thereof:

1. May review any:

(a) Records of birth, stillbirth, death or fetal death maintained by the State Registrar of Vital Statistics;

(b) Records of examinations or tests conducted pursuant to NRS 442.008; and

(c) Lists or records made available pursuant to NRS 442.325, for any information pertinent to birth defects or adverse birth outcomes.

2. Shall, upon identifying a patient who has:

(a) A condition indicating that the patient may have a birth defect; or

(b) Been discharged with an adverse birth outcome,

contact the patient or, if the patient is a minor, a parent or legal guardian of the patient, to determine the extent to which the patient will participate in the activities of the system.

(Added to NAC by Bd. of Health by R176-99, eff. 2-10-2000)

NAC 442.056 Notice of inclusion of certain information in system; request for exclusion of name of patient. (NRS 442.320)

1. Before including any information in the system that would reveal the identity of a patient, the Chief Medical Officer or a representative thereof shall advise the patient or, if the patient is a minor, a parent or legal guardian of the patient, that:

(a) The name of the patient will be used for research and referrals to related services unless the patient or his or her parent or legal guardian requests in writing to exclude the name from the system;

(b) Any information obtained by the system that would reveal the identity of the patient will remain confidential;

(c) Access to the information contained in the system is limited to persons who are:

(1) Employed by the Division of Public and Behavioral Health of the Department of Health and Human Services or the University of Nevada School of Medicine; and

(2) Authorized and approved by the Chief Medical Officer or the representative; and

(d) The information obtained by the system may be used only as set forth in NRS 442.330.

2. The Chief Medical Officer and the representatives shall:

(a) Exclude from the system the name of a patient if the patient or, if the patient is a minor, a parent or legal guardian of the patient has requested in writing to exclude the name of the patient from the system; and

(b) Cause the request to be maintained with the records for the patient.

(Added to NAC by Bd. of Health by R176-99, eff. 2-10-2000)

NAC 442.058 Access to and confidentiality of information in system. (NRS 442.330) The Chief Medical Officer shall establish appropriate procedures and take any other actions necessary to ensure that:

1. Access to the information contained in the system is limited to persons who are:

(a) Employed by the Division of Public and Behavioral Health of the Department of Health and Human Services or the University of Nevada School of Medicine; and

(b) Authorized and approved by the Chief Medical Officer or the representative;

2. Any information obtained by the system that would reveal the identity of a patient remains confidential; and

3. Except as otherwise provided in subsection 3 of NRS 442.330, the information obtained by the system is used solely for the purposes set forth in subsection 1 of that section.

(Added to NAC by Bd. of Health by R176-99, eff. 2-10-2000)

#### INFORMATION OBTAINED IN ADMINISTRATION OF PROGRAMS

NAC 442.060 Confidential records. (NRS 442.140, 442.190, 442.330)

1. Except as otherwise provided in subsection 2 or required to carry out NRS 442.300 to 442.330, inclusive, and NAC 442.052 to 442.058, inclusive:

(a) Any information concerning personal facts and circumstances obtained by the State or a local staff administering the program of services for maternal and child health and the care and treatment of children with special health care needs is a privileged communication and must be held confidential.

(b) The information must not be divulged without the consent of the person seeking or receiving services or the consent of his or her parent or guardian if he or she is a minor.

2. The information may be disclosed without consent if it is in a summary, statistical or other form which does not identify the person receiving or seeking services.

[Bd. of Health, Confidentiality of Records Reg. § 1, eff. 6-5-72; A and renumbered as § 1.0, 12-20-79] — (NAC A by R176-99, 2-10-2000)

NAC 442.070 Chief Medical Officer to control information. (NRS 442.140, 442.190, 442.330) The Chief Medical Officer shall control confidential information, designate persons who may utilize and disclose the information, and acquaint those persons with all regulations concerning confidential information.

[Bd. of Health, Confidentiality of Records Reg. § 2, eff. 6-5-72; A and renumbered as § 1.1, 12-20-79]

NAC 442.080 Chief of Bureau of Children's Services to inform employees of policy. (NRS 442.140, 442.190, 442.330) The Chief of the Bureau of Children's Services shall inform all employees of the Bureau of regulations relating to confidential materials.

[Bd. of Health, Confidentiality of Records Reg. § 3, eff. 6-5-72; A and renumbered as § 2.0, 12-20-79]

NAC 442.090 Chief Medical Officer to establish procedures for enforcement. (NRS 442.140, 442.190, 442.330) The Chief Medical Officer shall establish appropriate procedures to ensure the enforcement of NAC 442.060, 442.070 and 442.080.

[Bd. of Health, Confidentiality of Records Reg. § 4, eff. 6-5-72; A 12-20-79]

## APPENDIX E

# PULSE OXIMETRY SCREENING FOR CRITICAL CONGENITAL HEART DISEASE

## NEVADA FACT SHEET

### OVERVIEW

Congenital heart defects are malformations of the heart or major blood vessels occurring before birth<sup>1</sup>. These malformations may be identified provided the proper screenings take place. Congenital heart defects occur in 8 out of 1,000 live births,<sup>2,3</sup> and are the most common cause of infant death, accounting for 27% of infant deaths caused by birth defects.<sup>4</sup> A quarter of infants who have congenital heart defects will be diagnosed with critical congenital heart disease (CCHD). CCHD is a life-threatening condition requiring surgery or catheter intervention within the first year of life.<sup>5</sup>

Fortunately, an emerging body of evidence suggests measuring blood oxygen saturation can increase the chances for early diagnosis and detection of CCHD.<sup>8</sup> Once detected, many heart defects can be surgically repaired. It is estimated 85% of neonates undergoing surgery for CCHD will reach adulthood.<sup>9</sup>

### PULSE OXIMETRY SCREENING

Pulse oximetry screening is a lifesaving, low-cost (at just under \$4 per infant), non-invasive, and painless bedside diagnostic test which can be completed by a technician in as little as 45 seconds.<sup>5,7</sup> The American Heart Association (AHA), the American Academy of Pediatrics (AAP), and the American College of Cardiology Foundation (ACCF) recently made recommendations for standardized pulse oximetry screening and diagnostic follow-up. The recommended screening is performed on asymptomatic newborns after 24 hours of birth and before 48 hours of life, in order to avoid false-positive results.<sup>6</sup>

Studies show pulse oximetry screenings have less than one percent chance of giving a false positive result when used for CCHD screenings. Although prenatal ultrasounds and postnatal physical exams successfully detect many heart defects, and detection rates have improved since their advent, they are not sufficient to diagnose all cases of CCHD. Prenatal ultrasounds detect less than 50% of CCHD,<sup>5</sup> and screening rates vary based on differing levels of access to prenatal ultrasound equipment and degree of practitioner training.

Pulse oximetry testing is conducted to estimate the percentage of hemoglobin in the blood saturated with oxygen. When pulse oximetry screening identifies newborns with low blood oxygen levels, echocardiography can be used for definitive diagnosis of heart defects. Research suggests when all infants are screened using pulse oximetry in conjunction with routine newborn screening practices, CCHD can be detected in over 90% of affected newborns.<sup>8</sup>

### AMERICAN HEART ASSOCIATION (AHA) POLICY ADVOCACY

The AHA is committed to advancing public policies allowing children and adults with heart defects to live longer and fuller lives. These policies include:

- State adoption of mandatory CCHD screening using pulse oximetry for all newborns;

- Collection of screening data to be used for surveillance, evaluation and continuous quality improvement of CCHD screening;<sup>6</sup>
- Development, dissemination, and validation of screening standards for CCHD;
- Continued development of Food and Drug Administration's (FDA) guidance document regarding the safety and effectiveness of pulse oximeters.<sup>9</sup>

## NEVADA STATE POLICY

The State of Nevada worked with AHA and other stakeholders to implement Nevada Revised Statutes (NRS) 442.680, (<http://www.leg.state.nv.us/Division/Legal/LawLibrary/NRS/NRS-442.html#NRS442Sec680>) to address CCHD screenings.

Since July 1, 2015, all hospitals or freestanding birthing center must screen all newborns, after 24 hours of birth and prior to 48 hours of life, to determine if the newborn suffers from CCHD. If it is determined the infant suffers from CCHD, the attending physician must also report the condition to the Division of Public and Behavioral Health (DPBH) Chief Medical Officer, or a representative thereof, and discuss the condition with those responsible for the care of the infant.

*NRS 442.680 Examination required; confirmation of results; exception to requirement; regulations.*

*1. Except as otherwise provided in subsection 3, any physician, midwife or nurse attending or assisting in any way any infant at childbirth at a freestanding birthing center or a hospital which regularly offers obstetric services in the normal course of business and not only on an emergency basis shall make or cause to be made an examination of the infant, to determine whether the infant may suffer from critical congenital heart disease, including, without limitation, conducting pulse oximetry screening. If the physician, midwife or nurse who conducts the examination is not the attending physician of the infant, the physician, midwife or nurse shall submit the results of the examination to the attending physician of the infant.*

*2. If the examination reveals that an infant may suffer from critical congenital heart disease, the attending physician of the infant shall conduct an examination to confirm whether the infant does suffer from critical congenital heart disease. If the attending physician determines that the infant suffers from critical congenital heart disease, the attending physician must:*

*(a) Report the condition to the Chief Medical Officer or a representative of the Chief Medical Officer; and*

*(b) Discuss the condition with the parent, parents or other persons responsible for the care of the infant and inform them of the treatment necessary for the amelioration of the condition.*

*3. An examination of an infant is not required pursuant to this section if either parent files a written objection with the person responsible for conducting the examination or with the freestanding birthing center or hospital at which the infant is born.*

*4. The State Board of Health may adopt such regulations as necessary to carry out the provisions of this section.*

(Added to NRS by [2013, 2115](#))

## SCREENING DATA COLLECTION

The Division of Public and Behavioral Health (DPBH), Maternal and Child Health (MCH) Program receives the CCHD screening reports required by NRS 442.680, collecting screening data for surveillance, evaluation, and continuous quality improvement. All birthing hospitals in Nevada currently report; however, hospitals began reporting on different dates. Once a full year of data from all Nevada birthing hospitals has been collected, the DPBH will generate a report on CCHD screening data and evaluating the results. Prior to the first full year of data collection from all birthing hospitals, improvements to the reporting form have been identified and made. DPBH completed the process of passing regulations in September 2016.

Question about the CCHD registry may be directed to Vickie Ives, 775-684-2201, [vives@health.nv.gov](mailto:vives@health.nv.gov).

## DATA COLLECTED FROM SCREENINGS

Working in partnership with Nevada birthing hospitals, Nevada Hospital Association (NHA), and AHA, the DPBH has been able to provide technical assistance and ensure all Nevada birthing hospitals are reporting.

The data points collected with CCHD reporting include monthly counts for number of screens, number of births, number of failed screens, and percent of failed screens. The reporting form also includes discrepancy explanation for differences in number of screens and births for the month reported, patient information for failed screenings, and whether the failed screening was found via prenatal detection.

A newborn passes pulse oximetry screening if the oxygen saturation is 95% or greater in the right hand and right foot and the difference is three percentage points or less between the right hand and right foot. The screen is immediately failed if the oxygen saturation is less than 90% in the right hand and right foot. If the oxygen saturation is greater than 90% and less than 95% in the right hand and right foot, or there is more than a three percent difference between the right hand and right foot, the screen is repeated in one hour and follows the same process as above. Some newborns will require three screens (the initial and two repeat screens, all separated by one hour). A baby whose oxygen saturation is from 90% to less than 95% in either the right hand or right foot, or who has more than a three percent difference between the right hand and right foot after the third screen, will be considered to have failed screening.

After a failed screening is recorded, the hospital must take measures to follow-up with further testing. The follow-up actions must be documented on the CCHD screening report form with failed patient information.
